## TRIGONOMETRIC FUNCTIONS

Note: All these formats are interchangeable: $\sin ^{-1} t=i n v \sin t=\arcsin t$

| The $\sin (t)$ and $\sin ^{-1}(t)$ functions | The cos (t) and $\cos ^{-1}(t)$ functions | The $\tan (t)$ and $\tan ^{-1}(t)$ functions |
| :---: | :---: | :---: |
|   |   |   |

Table of Domain and Range for Basic Trig functions.

| Function | $\mathrm{y}=\sin \mathrm{t}$ | $\mathrm{y}=\cos \mathrm{t}$ | $\mathrm{y}=\tan \mathrm{t}$ |  | $\sin \theta$ | $\cos \theta$ | $\tan \theta$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Domain | $(-\infty, \infty)$ | $(-\infty, \infty)$ | $\mathrm{t} \neq \pm \pi / 2 \pm 2 \mathrm{n} \pi$ |  | $[-1,1]$ | $[-1,1]$ | $(-\infty, \infty)$ |
| Range | $[-1,1]$ | $[-1,1]$ | $(-\infty, \infty)$ |  | $[-\pi / 2, \pi / 2]$ | $[0, \pi]$ | $(-\pi / 2, \pi / 2)$ |

For Geometric uses of trigonometric functions

| $y$ is a ratio of sides <br> $y$ is non-dimensional <br> i.e. $y$ is always unitless | $\mathrm{y}=\sin \mathrm{t}$ <br> $\mathrm{y}=\cos \mathrm{t}$ <br> $\mathrm{y}=\tan \mathrm{t}$ | t is an "angle" <br> t is in either <br> deg or radians |
| :---: | :---: | :---: | :---: | :---: | :---: |$\quad$| y is an "angle" |
| :---: |
| y is either |
| deg or radians | | $\mathrm{y}=\sin ^{-1} \mathrm{t}$ |
| :---: |
| $\mathrm{y}=\cos ^{-1} \mathrm{t}$ |
| $\mathrm{y}=\tan ^{-1} \mathrm{t}$ |$\quad$| y is non-dimensional |
| :---: |
| i.e. y is unitless |

## GRAPHING BASICS <br> Notation for $y=A \sin [b(t-h)]+k$

One Period $(\mathrm{p})=$ One Wavelength $(\lambda)=$ Time of One Cycle $(T)$
Frequency (f) = cycles/sec $=\operatorname{Hertz}(\mathrm{Hz}) . \mathrm{f}=1 / \mathrm{T}=\mathrm{b} /(2 \pi)$
$\mathrm{A}=$ amplitude. $\mathrm{Max} / \mathrm{min}$ displacement from equilibrium

$\mathrm{b}=$ the number of cycles in $2 \pi$.
Sometimes you can easily count 'b'.
In this example, $\mathrm{b}=5$.
Sometimes you must compute b.
To compute $b$, measure one or more waves to compute T . Then $\mathrm{b}=$ $2 \pi / T$.

Here $T=40 / 5=8 . \quad b=2 \pi / 8=\pi / 4$

For $\mathrm{y}=\mathrm{f}(\mathrm{x}) \sin (\mathrm{bx}), \mathrm{f}(\mathrm{x})$ acts as the amplitude for $\sin (\mathrm{bx})$
Here, $\mathrm{f}(\mathrm{x})$ is a linear function of the form mx. To find m , use any local max data
point.
